## Abstract

In this paper we construct single sampling plans for reliability inspection using a combination between the attributive method already standardized (see Kirkpatrick, 1970 [11], pp. 354 – 415) and a specific failure behaviour of underlying units submitted for testing. This method establishes a link between the fraction defective ( $p$ ) of the batch and the hazard rate function assumed to be a Rayleigh one – that is a linearly increasing form. Some examples and all tables needed for operational purposes are given.

**Keywords:** hazard rate, AQL (Acceptable Quality Level), Rayleigh distribution, sampling scheme.
